RE: DRAFT ONLY – Guidance for Hospital Co-Location with Other Hospitals or Healthcare Facilities

Dear Ms. Verma:

On behalf of our nearly 5,000 member hospitals, health systems and other health care organizations, our clinician partners – including more than 270,000 affiliated physicians, 2 million nurses and other caregivers – and the 43,000 health care leaders who belong to our professional membership groups, the American Hospital Association (AHA) appreciates the opportunity to comment on the Centers for Medicare & Medicaid Services’ (CMS) proposed guidance for hospital co-location with other hospitals or health care facilities.

The AHA appreciates CMS’s work to articulate the guidance by which hospitals can co-locate with other hospitals or health care facilities. This draft guidance represents an important update to existing CMS policy, and we commend the agency for its overall recognition that the opportunity for co-location provides much needed flexibility for the development of and continued partnership between certain hospitals, health systems and other health care entities. While the agency’s general allowance of co-location demonstrates an important update, we urge it to consider a series of revisions that will enable successful implementation of this policy in health care settings and promote safer, higher-quality care.

For hospitals, the option and ultimate decision to co-locate is only as meaningful as the benefits both patients and the providers who treat them receive as part of a more streamlined and coordinated process. Failure to provide critical flexibility for these co-located entities significantly hampers the benefits of such arrangements, diminishing the value of co-location, and likely leading to far less utilization of the option to co-locate. For these reasons, we recommend the agency consider a series of revisions and
clarification to key components of the guidance. Specifically, we ask CMS to revise provisions related to distinct and shared space, staffing contracts and emergency services. In addition, we request that the agency address a number of co-location possibilities not directly discussed in its draft guidance. Our specific comments and suggested revised language follow.

Background

Clarity in application of the Conditions of Participation (CoPs) in co-located hospital arrangements is vital to hospitals, health care systems and health care entities interested in entering such arrangements. Hospitals use co-location to work together to create structures and mechanisms that leverage the services of a partner, co-located hospital to provide safe, high-quality and efficient services to its patients. We are aware that any complex hospital environment may carry some risk and that the natural inclination is to simplify structures as much as possible to provide clarity. However, we believe that some of the draft changes contained in the draft guidance will negatively impact patient care, create significant administrative burden and require increased expenditure of resources without patient safety benefit and, in some cases, impinge on the ability of co-located hospitals to provide the safest possible care. Further, the co-located hospitals that will be affected by this guidance include some of our nation’s premier children’s hospitals, cancer hospitals and psychiatric hospitals.

We are concerned that a one-size-fits-all approach could harm innovative and efficient solutions that are currently successful in delivering top-quality patient care. In addition, we recognize the challenge in writing clear standards that can apply effectively in many distinct situations presents, and offer a series of suggestions to assist the Agency. For ease of reference, co-located hospitals will be referred to as “Hospital A” and “Hospital B” in the examples to follow.

Undefined Terminology

CMS introduces a number of terms in the draft guidance but does not fully define the new terminology. In order to provide necessary clarity around the use of certain terms in the proposed guidance, we recommend CMS include a section specifically defining certain terms. We have included several examples below:

1. Distinct Space – areas of one hospital maintained by and used for the provisions of services for patients in only that hospital. Distinct spaces would include clinical spaces designated for patient care in one hospital and do not allow for the travel of non-patients or non-hospital staff through those areas.

2. Staffing Contracts – agreements for the provision of a certain type of service or care not directly provided by the hospital contracting for those services.
3. Emergency Services – the provision of immediate medical care to an individual who is suffering from a medical emergency, regardless of where the medical emergency occurs within a hospital. This includes the identification of the emergency, initial treatment (resuscitation, use of an AED, etc.) in order to stabilize the patient before transferring him or her to another department or to the co-located hospital for further testing and treatment.

4. Emergency Department – a medical treatment facility or area of some hospitals specializing in emergency medicine, the acute care of patients who present without prior appointment, either by their own means or by that of an ambulance.

Distinct and Shared Space

In its draft guidance, CMS proposes to establish a bright line standard for shared and distinct spaces. The agency reasons that this distinction is necessary to ensure patient safety and privacy protection while those patients are treated in a co-located hospital or health care facility. Patient safety and privacy protection are top priorities for our members, and we appreciate the agency’s attention to those critical issues; however, we fail to understand the justification for such a black-and-white approach. We do not understand the agency’s given rationale, and urge CMS to reconsider its approach on this issue by removing the prohibition of patient travel through clinical areas.

Currently, patients may travel through clinical areas within one hospital. We see no reason why those patients should be prohibited from transiting through a clinical space in a co-located hospital if it is the most direct path to a treatment or testing area where they will receive a service. Of course, we are not advocating for unsupervised movement through clinical areas, nor should family members or other non-patients be permitted to do so; however, patients from Hospital A who must travel to Hospital B to receive certain services should be permitted to travel through clinical areas when escorted by authorized staff. Not only will this decrease the need for costly and unnecessary engineering investments, but, more importantly, it will allow patients to receive the most effective and efficient high-quality care.

For example, if Hospital A contracts for radiology services in Hospital B, and the most direct path of travel from Hospital A is down a hallway in a patient unit in Hospital B, the patient should be permitted to travel along that route, regardless of its designation as a “distinct” space. Under CMS’s proposed guidance, patients may have to exit Hospital A and come back into the co-located entity through its separate entryway. Or, the patient may have to travel through patient areas in Hospital A to access a public corridor or other public area, and then enter Hospital B, and then travel through Hospital B’s public corridors to get to the service they need. The patient would then have to reverse this process to return to Hospital A again after receiving services in Hospital B. The route, as required by CMS’s guidance, actually poses a greater threat to patient safety and privacy protection, exposing the patient to the public in the public areas.
Further, as drafted, this guidance will significantly increase the chances of inconveniencing the patient and the caregiver(s) accompanying the patient by forcing the patient to traverse a longer, more convoluted route. For example, if Hospital A had a breast health clinic and contracted for use of the diagnostic imaging center in Hospital B, this guidance would mean that a woman seeing a physician in the breast health clinic and needed a mammogram would have to dress, leave the clinic exam room, walk out of the clinic and into the public area, walk through the public area to the entrance to the imaging center, undress, get the mammogram, redress, walk out of the imaging area, through the public space to the clinic entrance, go back to the exam room, undress and await the return of her physician. We firmly believe that our patients deserve the simplest, least cumbersome care we can provide. Being sick or needing medical treatment is stressful enough. Anything we – or CMS – can do to ensure unnecessary hassles are not part of the experience will be to the benefit of the patients the agency and our hospitals seek to serve.

Allowing patient travel through clinical areas, quite simply, makes sense, and is likely a more effective way to protect patients and preserve their privacy. It should be prohibited only when a real threat to patient safety or privacy exists. We understand and share the agency’s concern regarding the need to protect patients from potential infections. All hospitals, including co-located entities, take this responsibility seriously. That said, we do not understand the concern raised in the draft guidance suggesting that the transit of a patient from one hospital through a clinical space owned by another creates an infection control concern that should lead the agency to prohibit that as a path to needed services. The spread of infection does not cease when one entity ends and another begins, and neither should a health care facility’s infection control plan. A coordinated approach to infection control is better equipped to keep patients safe. Clearly, the contractual language between facilities should indicate which entity has responsibility for ensuring shared spaces (and the equipment and supplies in them) are appropriately cleaned, sterilized and maintained. We urge the agency simply to require that the co-located organizations specify the responsibility for infection control procedures in the contract. Further, CMS should encourage the co-located entities to coordinate their infection control efforts so that both entities are aware of and attentive to any special needs or concerns for infection control based on the patients served.

Given the broad adoption of electronic health records by hospitals, we do not understand CMS’s espoused concern with regard to the privacy of medical records in co-located facilities. Electronic health record (EHR) systems have safeguards to prevent inappropriate access of information and to ensure the security of the data in the record. One of the benefits of EHRs is that individuals with legitimate reason to access the patient’s information can do so from many different locations, and those who inappropriately access the records can be identified and the hospital can address the issue accordingly. Physical proximity to where a patient’s record is kept is no longer necessary or helpful in accessing the record because records are stored on servers or in “the cloud.” Thus, we fail to understand why the agency is concerned that co-location
of two providers might offer greater opportunity for violations of patient’s health record privacy.

In light of the issues raised in this section, we strongly suggest CMS revise this section to allow for supervised patient movement through clinical spaces.

**Staffing Contracts**

CMS proposes a series of requirements around staffing contracts for co-located hospitals and health care facilities. We thank the agency for placing an emphasis on the importance of adequate staffing in each facility, but we have concerns about the justifications for and implications of some of the proposed provisions in this section. Specifically, we ask the agency to revise three provisions: 1) the prohibition on nursing, pharmacy, and laboratory directors and certain other staff from “floating”; and 2) the role of the governing body with regard to contracted services.

**Directors.** CMS proposes to prohibit directors of nursing, pharmacy and laboratory from working simultaneously in co-located hospitals and health care facilities. The agency explains that the proposed guidance does not preclude these individuals from serving their roles in both hospitals; however, they may not do so at the same time. In its provided justification, CMS states that each hospital must be able to provide necessary services, like nursing, at all times and, if directors of these departments “float,” the requirement cannot be met. We disagree and find this provision a potentially significant barrier for those hospitals interested in co-locating. In fact, the ability for one director to serve both entities at the same time, when appropriate, likely is in the best interest of the patient.

For example, if Hospital A and Hospital B are co-located and treat cancer patients, a coordinated and streamlined approach that one director of pharmacy provides will greatly diminish the possibility of errors when prescribing and dispensing medications in both Hospitals A and B. One director will ensure a uniform prescribing process and proper oversight of both entities, ensuring higher-quality patient care and more efficient and effective prescribing practices. This same example also applies to directors of nursing and laboratory, where streamlined and coordinated approaches with one final decision maker present the best environment for patient care. Failure to remove the “floating” prohibition likely will result in additional barriers and differences in process that could increase, not decrease, the risk of error. Therefore, we recommend CMS revise the first paragraph on page three to remove the proposed language prohibiting director “floating” and replace it with the express allowance for co-located entities to have one director of a department should they choose to do so.

Of note, we also recommend that the agency consider allowing other director-level employees, like facilities’ managers to “float.” Like clinical directors, these other types of director-level staff would provide a more coordinated approach to their work, and the scheduling of such projects in both Hospital A and Hospital B.
Other Staff. In addition to allowing directors of certain departments to “float,” we urge the agency to consider also permitting certain staff to float. There are many different types of employees in hospitals. Broadly speaking, they can be classified into:

- those who primarily have specific responsibility for the continuous care of a defined group of patients in a specific unit;
- those who move through the organization to provide specific services to any patient who needs the service; and
- those who provide specific services in a defined location in the hospital to any patient who needs the service.

Nurses assigned to a specific inpatient unit are an example of the first category. Laboratory technicians who move through the organization to collect biologic samples and physical therapists who serve patients on many different units are examples of the second group. MRI technicians are an example of the third.

We understand and value the importance of ensuring that nurses assigned to units only serve patients in their designated units to ensure high-quality patient care. They should not be allowed to work in Hospitals A and B simultaneously. However, other employees who provide necessary services to and for whichever patients need those services should be permitted to “float” between Hospitals A and B to provide services as needed – or what might be called “on demand services.” Further, those who provide services that require the use of a special room or equipment should be allowed to care for patients from the co-located organizations when those patients are brought to them.

The AHA urges CMS to permit contracts between co-located facilities to allow patients to be served by any employee who does not have designated responsibility for the continuous care for a group of patients; specifically, to allow this employee to provide services to any patient within either health care organization who requires a service that employee is trained and able to provide. The theoretical risk that CMS cites – that Hospital B will “call away” the service provider from Hospital A or prevent the service provider from supplying the service for Hospital A – simply has not materialized. On-demand services are in fact an appropriate and efficient approach to ensuring that the very best patient care services are available to the co-located hospitals whenever those patients are brought to them.

We hope the agency agrees that a decrease in shuttling patients between hospitals, whenever possible, is the best option for the patient. Further, as an added benefit of this revision there undoubtedly will be an increase in efficiency for the contracted services in both hospitals. Therefore, we recommend CMS simply remove the non-float provisions for staff other than those with continuous responsibility for the welfare of patients, giving co-located hospitals the option to increase efficiency and coordination when necessary and appropriate.
Governing Body Provisions and Requirements. We appreciate the agency’s commitment to ensuring that staffing levels are adequate and staff are appropriately trained. In order to better account for the importance of meeting these requirements, we urge CMS to add language permitting the delegation of assurances concerning staffing contracts to each entity’s respective clinical leadership groups that handle these issues if applicable. These clinical leadership groups are more experienced in these issues and better positioned to respond to any inquiries that may arise.

Second, the agency states that “governing body approved medical staff may be shared, or ‘float,’ between the co-located hospitals.” We assume this language is meant to include doctors, nurse practitioners, dentists, physician assistants and other similarly trained staff, but ask the agency to confirm and, if possible, provide an approved list of medical personnel permitted to “float.”

Emergency Services

CMS proposes a series of requirements related to the provision of emergency services for co-located hospitals and health care facilities. Specifically, the agency addresses policies and procedures that each facility must have in place; requirements for who must respond to a medical emergency; contracting for emergency services; transfer agreements between co-located facilities; and EMTALA requirements for those hospitals without emergency departments (EDs) that contract for emergency services. While we appreciate the agency’s commitment to ensuring that patients experiencing medical emergencies are treated and stabilized immediately, we find a number of the proposed requirements concerning.

First, the agency’s language conflates the provision of ED services, which are meant to provide care to individuals in the community who are experiencing urgent medical situations, and hospitalized patients who are being cared for at the facility and who experience an emergency situation. We ask the agency to provide clarity to the term “emergency services.” Clearness of the meaning of these terms is critical for our hospitals to make the right compliance decisions. In its draft guidance, CMS seems to assume that the provision of emergency services is synonymous with the term “emergency department,” or, at the very least, that only ED staff provide emergency services. However, this is not the case, and there are significant differences between emergency services and an ED.

EDs are those units in which individuals in the community who are suffering from a medical emergency are brought to be treated. Emergency services, on the other hand, are not unique to the ED and are provided whenever a patient, whether in an ED or other area within the hospital, experiences a medical emergency. The provision of emergency services specifically relates to providing initial treatment and stabilization, no matter where in the hospital the patient experiences the emergency. Due to the distinct differences in the definitions and application of these terms, it is problematic to use them interchangeably, or to assume that emergency services are provided only in the
ED or by ED staff. We urge the agency to reevaluate the use and appropriateness of each term and make necessary adjustments in its draft guidance in order to minimize confusion.

Additionally, rapid response and transport teams are not emergency services. While emergency services are a response to a patient in crisis, rapid response teams are sent to assess patients who may be experiencing unusual symptoms or who may be deteriorating unexpectedly, but not in crisis. One important function of the rapid response teams is to stave off crises. Because they are not emergency services, we believe they should be services for which a hospital can contract. The agency should directly and expressly remove rapid response teams from the emergency services provisions of the guidance.

Second, as CMS is aware, hospitals are not required to have an ED, but whether hospitals have an ED or not, patients undergoing diagnostic procedures and treatment at hospitals may experience emergency situations. We agree with CMS that all hospitals must be able to provide an appraisal and initial treatment to patients under their care who experience a medical emergency. Further, we agree that hospitals must have policies and procedures in place to identify when a patient is in distress, how to initiate an emergency response, how to initiate initial treatment (for example, CPR and the use of AED) and recognizing when the patient must be transferred to another facility to receive appropriate treatment. However, these services to hospital patients may or may not be provided by the ED staff in hospitals that have an ED, and would necessarily be provided by other clinicians in hospitals that do not have an ED. We believe that CMS’s guidance attempts to sort out the rules for provision of emergency services to hospital patients, not the community, so we are confused by the reference to EMTALA. For EMTALA to apply, the hospital would have to be holding itself out to the community as a provider of emergency services, not simply responding to the emergency needs of patients already being served at the hospital. We urge CMS to remove the draft language around EMTALA.

Third, we are aware of a number of co-located entities in which there are existing arrangements to ensure that the best-qualified individuals perform emergency services for patients. We find the language of the draft guidance regarding such arrangements confusing and sets up barriers that would, in all likelihood, make it impossible for co-located hospitals to engage in such arrangements.

We recommend the agency revise its draft language around contracting for the provision of emergency services. In its proposal, CMS states that a health care facility may contract for the provision of emergency services from a co-located hospital or facility, but the contracted staff may not work or be on duty simultaneously in both facilities. Our concern stems from the agency’s proposal not to allow emergency response teams to respond to a medical emergency in a co-located entity while being on-duty in their primary facility. In the interest of ensuring the highest quality of care for
those patients experiencing a medical emergency, we strongly urge the agency modify
this proposed requirement.

The focus should be on the ability to respond to an emergency, regardless of whether
the emergency is in Hospital A or Hospital B, rather than proposing that each hospital
must respond to their own emergencies, even if staff from the co-located hospital is
better equipped and experienced to respond. For example, assume Hospital A is a large
acute care hospital and Hospital B is a co-located children’s hospital. If an adult
individual in Hospital B is experiencing a medical emergency, Hospital A staff is likely
better positioned and more experienced to respond to an adult medical emergency.
Likewise, if a child in Hospital A is experiencing a medical emergency, Hospital B staff is
positioned to better respond and provide initial treatment, as well as any additional
medical services once the child is stabilized.

Specifically, we understand the agency’s concerns and appreciate its focus on making
sure that co-located entities are prepared and able to respond to emergencies.
However, the outright prohibition on allowing emergency response teams to respond
when necessary is definitively not in the best interest of patients or the providers who
care for them. Rather, we suggest CMS revise this language to allow a contracted
emergency response team from a hospital to respond to an emergency in the co-
located facility, so long as the initial hospital maintains at least one response
team available to respond to a code at the primary hospital. This same principle
would apply to a hospital experiencing two codes simultaneously.

We suggest CMS change the text of the Emergency Services section to read:

*Hospitals must have appropriate policies and procedures in place for addressing
individuals’ emergency care needs 24 hours per day and 7 days per week. Policies and
procedures should include: (1) identifying when a patient is in distress, (2) how to initiate
an emergency response (e.g., calling for staff assistance and the on-call physician or
calling for the contracted emergency services team from the co-located hospital), (3)
how to initiate treatment (e.g., CPR and the use of an Automated External Defibrillator
(AED)), and (4) recognizing when the patient must be transferred to another facility to
receive appropriate treatment.*

*The requirements of this section only apply to the provision of emergency services to
hospital patients. Emergency services include the initial treatment and appraisal,
resuscitation, stabilization and other necessary code services. Emergency services do
not include those services furnished by an emergency department or its staff, unless
that staff is also designated as an emergency response team for the hospital nor does it
include services provided by rapid response or transport teams.*

*Hospitals must anticipate potential emergency scenarios typical of the patient
population it routinely cares for in order to develop policies, procedures and ensure
staffing that would enable it to provide safe an adequate initial treatment of an
emergency. Contracting with another hospital or entity for the appraisal and initial treatment of patients experiencing an emergency is permitted, so long as the contracted team’s hospital maintains at least one emergency services team available to respond to a code in that hospital. Emergency response teams are permitted to work in one hospital and simultaneously respond to an emergency in the co-located entity as long as the above requirement that at least one emergency response team remains available is met.

In instances where a patient experiencing an emergency must be transferred, it is appropriate to have a contracted emergency response team from the co-located hospital respond to provide initial treatment and then transfer the patient to the co-located hospital. While all health care facilities must have staff trained and able to respond to their own emergencies, contracted emergency response teams may serve in this role when possible.

EMTALA is not applicable to those hospitals without emergency departments that contract for emergency services from another hospital.

This revision is important for several reasons. First, in situations where a hospital is co-located with another health care facility, like a rehabilitation center, hospital emergency response teams are more likely to be experienced in the initial treatment and stabilization of those patients experiencing medical emergencies. Second, in instances where a transfer agreement exists, it is in the best interest of the patient to be treated initially by clinical staff from the facility he or she will be transferred. Finally, the language as proposed is likely to place clinical staff in an impossible situation, forcing those individuals to choose between stabilizing a patient or adhering to the CoPs. Again, we agree with the agency that co-located facilities should each ensure they are prepared to respond if necessary, and that the appropriate training and equipment is in place to respond. In practice, however, it makes the most sense to remove this prohibition in order to, when possible, have the most experienced team respond, regardless of where those individuals are “on-duty” at the time.

Survey Procedures

We appreciate CMS’s proposed changes to the survey process in order to reflect the updated requirements related to ligature risk. As the agency considers comments on this guidance, we urge it to adapt the survey requirements accordingly. Further, while these updates are necessary to ensure compliance for the benefit of both patients and the staff who cares for them, it is equally critical that surveyors receive appropriate and thorough training to ensure uniformity across the entirety of the surveyor profession. This means increased training and demonstrated comprehension of the new requirements to ensure commonality among survey determinations. An in-depth understanding of what is acceptable and what is not is imperative in these instances to make it clear that hospitals in compliance on paper also are compliant in the minds of surveyors. In order to achieve this uniformity, we recommend CMS provide increased
specificity and direction concerning surveyor training. The goal should be to ensure that hospitals are held to an objective standard without the possibility for or instance of subjective treatment because of surveyor discretion. Lack of uniformity not only creates frustration, but it can also affect patient care and critical hospital resource allocation.

**Additional Language Required**

In addition to the areas addressed by CMS in the proposed guidance, we ask the agency to provide additional language around certain arrangements not directly addressed. First, we assume the agency’s intent is that this guidance will not apply to visiting physician services, time-sharing arrangements or physician leasing agreements. We ask the agency to confirm this assumption and provide language expressly allowing for such agreements. There are many instances when hospitals provide space to visiting physicians for certain hours or days of the week in order to provide clinical care to patients. The option to enter into these types of agreements is especially vital for small and rural hospitals, which do not have physicians on staff at all times and rely on visiting physicians to provide care that would otherwise require patients to travel long distances to visit the nearest hospital for that specific care.

Second, we urge CMS to address the issue of shared clinical space by expressly allowing for such arrangements. For example, there are situations where Hospital A and Hospital B share a clinical room for certain types of specialty care when neither hospital can afford or needs the room for its sole use at all times. In those instances, Hospital A and Hospital B have a set schedule for use of the room in order to guarantee only one hospital is using the space during a specific day or time. We ask the agency to confirm that these specific arrangements are permitted, and we expect both hospitals to have the appropriate protocols in place to ensure compliance.

Please contact me if you have questions, or feel free to have a member of your team contact Mark Howell, senior associate director, policy, at mhowell@aha.org or (202) 626-2274.

Sincerely,

/s/

Ashley B. Thompson
