Co-Authored by:

#StopRansomware: Rhysida Ransomware

SUMMARY

Note: This joint Cybersecurity Advisory (CSA) is part of an ongoing <u>#StopRansomware</u> effort to publish advisories for network defenders detailing various ransomware variants and ransomware threat actors. These #StopRansomware advisories include recently and historically observed tactics, techniques, and procedures (TTPs) and indicators of compromise (IOCs) to help organizations protect against ransomware. Visit <u>stopransomware.gov</u> to see all #StopRansomware advisories and to learn more about other ransomware threats and no-cost resources.

The Federal Bureau of Investigation (FBI), Cybersecurity and Infrastructure Security Agency (CISA), and the MultiActions to take today to mitigate malicious cyber activity:

TLP:CLEAR

Product ID: AA23-319A

November 15, 2023

TLP:CLEAR

- Prioritize remediating <u>known</u> <u>exploited vulnerabilities</u>.
- Enable multifactor authentication (MFA) for all services to the extent possible, particularly for webmail, VPN, and accounts that access critical systems.
- Segment networks to prevent the spread of ransomware.

State Information Sharing and Analysis Center (MS-ISAC) are releasing this joint CSA to disseminate known Rhysida ransomware IOCs and TTPs identified through investigations as recently as September 2023. Rhysida—an emerging ransomware variant—has predominately been deployed against the education, healthcare, manufacturing, information technology, and government sectors since May 2023. The information in this CSA is derived from related incident response investigations and malware analysis of samples discovered on victim networks.

FBI, CISA, and the MS-ISAC encourage organizations to implement the recommendations in the <u>Mitigations</u> section of this CSA to reduce the likelihood and impact of Rhysida ransomware and other ransomware incidents.

To report suspicious or criminal activity related to information found in this joint Cybersecurity Advisory, contact <u>your local FBI field office</u> or CISA's 24/7 Operations Center at <u>Report@cisa.gov</u> or (888) 282-0870. When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact. SLTT organizations should report incidents to the MS-ISAC (866-787-4722 or <u>SOC@cisecurity.org</u>).

This document is marked TLP:CLEAR. Disclosure is not limited. Sources may use TLP:CLEAR when information carries minimal or no foreseeable risk of misuse, in accordance with applicable rules and procedures for public release. Subject to standard copyright rules, TLP: CLEAR information may be distributed without restriction. For more information on the Traffic Light Protocol, see <u>cisa.gov/tlp</u>

TECHNICAL DETAILS

Note: This advisory uses the <u>MITRE ATT&CK[®] for Enterprise</u> framework, version 14. See the <u>ATT&CK Tactics and Techniques</u> section for tables mapped to the threat actors' activity.

Overview

Threat actors leveraging Rhysida ransomware are known to impact "targets of opportunity," including victims in the education, healthcare, manufacturing, information technology, and government sectors. Open source reporting details similarities between Vice Society (DEV-0832)[1] activity and the actors observed deploying Rhysida ransomware. Additionally, open source reporting[2] has confirmed observed instances of Rhysida actors operating in a ransomware-as-a-service (RaaS) capacity, where ransomware tools and infrastructure are leased out in a profit-sharing model. Any ransoms paid are then split between the group and the affiliates.

For additional information on Vice Society actors and associated activity, see the joint CSA <u>#StopRansomware: Vice Society</u>.

Initial Access

Rhysida actors have been observed leveraging external-facing remote services to initially access and persist within a network. Remote services, such as virtual private networks (VPNs), allow users to connect to internal enterprise network resources from external locations. Rhysida actors have commonly been observed authenticating to internal VPN access points with compromised valid credentials [T1078], notably due to organizations lacking MFA enabled by default. Additionally, actors have been observed exploiting Zerologon (CVE-2020-1472)—a critical elevation of privileges vulnerability in Microsoft's Netlogon Remote Protocol [T1190]—as well as conducting successful phishing attempts [T1566]. **Note:** Microsoft released a patch for CVE-2020-1472 on August 11, 2020.[3]

Living off the Land

Analysis identified Rhysida actors using living off the land techniques, such as creating Remote Desktop Protocol (RDP) connections for lateral movement [T1021.001], establishing VPN access, and utilizing PowerShell [T1059.001]. Living off the land techniques include using native (built into the operating system) network administration tools to perform operations. This allows the actors to evade detection by blending in with normal Windows systems and network activities.

Ipconfig [T1016], whoami [T1033], nltest [T1482], and several net commands have been used to enumerate victim environments and gather information about domains. In one instance of using compromised credentials, actors leveraged net commands within PowerShell to identify logged-in users and performed reconnaissance on network accounts within the victim environment. **Note:** The following commands were not performed in the exact order listed.

- net user [username] /domain [T1087.002]
- net group "domain computers" /domain [T1018]
- net group "domain admins" /domain [T1069.002]

TLP:CLEAR

• net localgroup administrators [T1069.001]

Analysis of the master file table (MFT)[4] identified the victim system generated the ntuser.dat registry hive, which was created when the compromised user logged in to the system for the first time. This was considered anomalous due to the baseline of normal activity for that particular user and system. Note: The MFT resides within the New Technology File System (NTFS) and houses information about a file including its size, time and date stamps, permissions, and data content.

Leveraged Tools

Table 1 lists legitimate tools Rhysida actors have repurposed for their operations. The legitimate tools listed in this joint CSA are all publicly available. Use of these tools should not be attributed as malicious without analytical evidence to support they are used at the direction of or controlled by threat actors.

Table **<u>1</u>**: Tools Leveraged by Rhysida Actors

Disclaimer: Organizations are encouraged to investigate and vet use of these tools prior to performing remediation actions.

| Name | Description | |
|----------------|--|--|
| cmd.exe | The native command line prompt utility. | |
| PowerShell.exe | A native command line tool used to start a Windows PowerShell session in a Command Prompt window. | |
| PsExec.exe | A tool included in the PsTools suite used to execute processes remotely. Rhysida actors heavily leveraged this tool for lateral movement and remote execution. | |
| mstsc.exe | A native tool that establishes an RDP connection to a host. | |
| PuTTY.exe | Rhysida actors have been observed creating Secure Shell (SSH) PuTTy connections for lateral movement. In one example, analysis of PowerShell console host history for a compromised user account revealed Rhysida actors leveraged PuTTy to remotely connect to systems via SSH [T1021.004]. | |
| PortStarter | A back door script written in Go that provides functionality for modifying firewall settings and opening ports to pre-configured command and control (C2) servers.[1] | |
| secretsdump | A script used to extract credentials and other confidential information from a system. Rhysida actors have been observed using this for NTDS dumping [T1003.003] in various instances. | |
| ntdsutil.exe | A standard Windows tool used to interact with the NTDS database. Rhysida actors used this tool to extract and dump the NTDS.dit database from the domain controller containing hashes for all Active Directory (AD) users. | |

| | Note: It is strongly recommended that organizations conduct domain-wide password resets and double Kerberos TGT password resets if any indication is found that the NTDS.dit file was compromised. |
|---|---|
| AnyDesk | A common software that can be maliciously used by threat actors to obtain remote access and maintain persistence [T1219]. AnyDesk also supports remote file transfer. |
| wevtutil.exe A standard Windows Event Utility tool used to view eve Rhysida actors used this tool to clear a significant numb Windows event logs, including system, application, and logs [T1070.001]. | |
| PowerView | A PowerShell tool used to gain situational awareness of Windows domains. Review of PowerShell event logs identified Rhysida actors using this tool to conduct additional reconnaissance-based commands and harvest credentials. |

Rhysida Ransomware Characteristics

Execution

In one investigation, Rhysida actors created two folders in the C:\ drive labeled in and out, which served as a staging directory (central location) for hosting malicious executables. The in folder contained file names in accordance with host names on the victim's network, likely imported through a scanning tool. The out folder contained various files listed in Table 2 below Error! Reference source not found. Rhysida actors deployed these tools and scripts to assist system and network-wide encryption.

| File Name | Hash (SHA256) | Description |
|-------------|--|--|
| conhost.exe | 6633fa85bb234a75927b23417313e 51a4c155e12f71da3959e168851a6 00b010 | A ransomware binary. |
| psexec.exe | 078163d5c16f64caa5a14784323fd5 1451b8c831c73396b967b4e35e687 9937b | A file used to execute a process on a remote or local host. |
| S_0.bat | 1c4978cd5d750a2985da9b58db137 fc74d28422f1e087fd77642faa7efe7 b597 | A batch script likely used to place 1.ps1 on victim systems for ransomware staging purposes [T1059.003]. |

Table 2: Malicious Executables Affiliated with Rhysida Infections

| 1.ps1 | 4e34b9442f825a16d7f6557193426a e7a18899ed46d3b896f6e43573672 76183 | Identifies an extension block list of files to encrypt and not encrypt. |
|---------|--|---|
| S_1.bat | 97766464d0f2f91b82b557ac656ab8 2e15cae7896b1d8c98632ca53c15cf 06c4 | A batch script that copies conhost.exe (the encryption binary) on an imported list of host names within the C:\Windows\Temp directory of each system. |
| S_2.bat | 918784e25bd24192ce4e999538be9 6898558660659e3c624a5f2785778 4cd7e1 | Executes conhost.exe on compromised victim systems, which encrypts and appends the extension of .Rhysida across the environment. |

Rhysida ransomware uses a Windows 64-bit Portable Executable (PE) or common object file format (COFF) compiled using MinGW via the GNU Compiler Collection (GCC), which supports various programming languages such as C, C++, and Go. The cryptographic ransomware application first injects the PE into running processes on the compromised system [T1055.002]. Additionally, third-party researchers identified evidence of Rhysida actors developing custom tools with program names set to "Rhysida-0.1" [T1587].

Encryption

After mapping the network, the ransomware encrypts data using a 4096-bit RSA encryption key with a ChaCha20 algorithm [T1486]. The algorithm features a 256-bit key, a 32-bit counter, and a 96-bit nonce along with a four-by-four matrix of 32-bit words in plain text. Registry modification commands [T1112] are not obfuscated, displayed as plain-text strings and executed via cmd.exe.

Rhysida's encryptor runs a file to encrypt and modify all encrypted files to display a .rhysida extension.[5] Following encryption, a PowerShell command deletes the binary [T1070.004] from the network using a hidden command window [T1564.003]. The Rhysida encryptor allows arguments -d (select a directory) and -sr (file deletion), defined by the authors of the code as parseOptions.[6] After the lines of binary strings complete their tasks, they delete themselves through the control panel to evade detection.

Data Extortion

Rhysida actors reportedly engage in "double extortion" [T1657]—demanding a ransom payment to decrypt victim data and threatening to publish the sensitive exfiltrated data unless the ransom is paid.[5],[7] Rhysida actors direct victims to send ransom payments in Bitcoin to cryptocurrency wallet addresses provided by the threat actors. As shown in Figure 1, Rhysida ransomware drops a ransom note named "CriticalBreachDetected" as a PDF file—the note provides each company with a unique code and instructions to contact the group via a Tor-based portal.

TLP:CLEAR

FBI | CISA | MS-ISAC

Figure 1: Rhysida Ransom Note

Identified in analysis and also listed in open source reporting, the contents of the ransom note are embedded as plain-text in the ransom binary, offering network defenders an opportunity to deploy string-based detection for alerting on evidence of the ransom note. Rhysida threat actors may target systems that do not use command-line operating systems. The format of the PDF ransom notes could indicate that Rhysida actors only target systems that are compatible with handling PDF documents.[8]

INDICATORS OF COMPROMISE

On November 10, 2023, Sophos published TTPs and IOCs identified from analysis conducted for six separate incidents.[9] The C2 IP addresses listed in Table 3 were derived directly from Sophos' investigations and are listed on GitHub among other indicators.[10]

| C2 IP Address |
|-----------------|
| 5.39.222[.]67 |
| 5.255.99[.]59 |
| 51.77.102[.]106 |

Table 3: C2 IP Addresses Used for Rhysida Operations

TLP:CLEAR

| 108.62.118[.]136 |
|------------------|
| 108.62.141[.]161 |
| 146.70.104[.]249 |
| 156.96.62[.]58 |
| 157.154.194[.]6 |

Additional IOCs were obtained from FBI, CISA, and the MS-ISAC's investigations and analysis. The email addresses listed in Table 4 are associated with Rhysida actors' operations. Rhysida actors have been observed creating Onion Mail email accounts for services or victim communication, commonly in the format: [First Name][Last Name]@onionmail[.]org.

Table 4: Email Addresses Used to Support Rhysida Operations

| Email Address |
|-----------------------------------|
| rhysidaeverywhere@onionmail[.]org |
| rhysidaofficial@onionmail[.]org |

Rhysida actors have also been observed using the following files and executables listed in Table 5 to support their operations.

Table 5: Files Used to Support Rhysida Operations

Disclaimer: Organizations are encouraged to investigate the use of these files for related signs of compromise prior to performing remediation actions.

MITRE ATT&CK TACTICS AND TECHNIQUES

See Tables 6-15 for all referenced threat actor tactics and techniques in this advisory. For assistance with mapping malicious cyber activity to the MITRE ATT&CK framework, see CISA and MITRE's <u>Best</u> <u>Practices for MITRE ATT&CK Mapping</u> and CISA's <u>Decider Tool</u>.

Additional notable TTPs have been published by the Check Point Incident Response Team.[11]

TLP:CLEAR

Table 6: Resource Development

| Technique Title | ID | Use |
|----------------------|--------------|---|
| Develop Capabilities | <u>T1587</u> | Rhysida actors have been observed developing resources and custom tools, particularly with program names set to "Rhysida-0.1" to gain access to victim systems. |

Table 7: Initial Access

| Technique Title | ID | Use |
|---------------------------------------|--------------|--|
| Valid Accounts | <u>T1078</u> | Rhysida actors are known to use valid credentials to access internal VPN access points of victims. |
| Exploit Public- Facing Application | <u>T1190</u> | Rhysida actors have been identified exploiting Zerologon, a critical elevation of privilege vulnerability within Microsoft's Netlogon Remote Protocol. |
| Phishing | <u>T1566</u> | Rhysida actors are known to conduct successful phishing attacks. |

Table 8: Execution

| Technique Title | ID | Use |
|---|------------------|---|
| Command and Scripting Interpreter: PowerShell | <u>T1059.001</u> | Rhysida actors used PowerShell commands (ipconfig, nltest, net) and various scripts to execute malicious actions. |
| Command and Scripting Interpreter: Windows Command Shell | <u>T1059.003</u> | Rhysida actors used batch scripting to place 1.ps1 on victim systems to automate ransomware execution. |

Table 9: Privilege Escalation

| Technique Title | ID | Use |
|--|------------------|---|
| Process Injection: Portable Executable Injection | <u>T1055.002</u> | Rhysida actors injected a Windows 64-bit PE cryptographic ransomware application into running processes on compromised systems. |

TLP:CLEAR

FBI | CISA | MS-ISAC

Table 10: Defense Evasion

| Technique Title | ID | Use |
|---|------------------|---|
| Indicator Removal: Clear Windows Event Logs | <u>T1070.001</u> | Rhysida actors used wevtutil.exe to clear Windows event logs, including system, application, and security logs. |
| Indicator Removal: File Deletion | <u>T1070.004</u> | Rhysida actors used PowerShell commands to delete binary strings. |
| Hide Artifacts: Hidden Window | <u>T1564.003</u> | Rhysida actors have executed hidden PowerShell windows. |

Table 11: Credential Access

| Technique Title | ID | Use |
|--------------------------------|------------------|---|
| OS Credential Dumping: NTDS | <u>T1003.003</u> | Rhysida actors have been observed using secretsdump to extract credentials and other confidential information from a system, then dumping NTDS credentials. |
| Modify Registry | <u>T1112</u> | Rhysida actors were observed running registry modification commands via cmd.exe. |

Table 12: Discovery

| Technique Title | ID | Use |
|---|------------------|---|
| System Network Configuration Discovery | <u>T1016</u> | Rhysida actors used the ipconfig command to enumerate victim system network settings. |
| Remote System Discovery | <u>T1018</u> | Rhysida actors used the command net group "domain computers" /domain to enumerate servers on a victim domain. |
| System Owner/User Discovery | <u>T1033</u> | Rhysida actors leveraged whoami and various net commands within PowerShell to identify logged-in users. |
| Permission Groups Discovery: Local Groups | <u>T1069.001</u> | Rhysida actors used the command net localgroup administrators to identify accounts with local administrator rights. |

TLP:CLEAR

| Technique Title | ID | Use |
|--|------------------|--|
| Permission Groups Discovery: Domain Groups | <u>T1069.002</u> | Rhysida actors used the command net group "domain admins" /domain to identify domain administrators. |
| Account Discovery: Domain Account | <u>T1087.002</u> | Rhysida actors used the command net user [username] /domain to identify account information. |
| Domain Trust Discovery | <u>T1482</u> | Rhysida actors used the Windows utility nltest to enumerate domain trusts. |

Table 13: Lateral Movement

| Technique Title | ID | Use |
|--|------------------|--|
| Remote Services: Remote Desktop Protocol | <u>T1021.001</u> | Rhysida actors are known to use RDP for lateral movement. |
| Remote Services: SSH | <u>T1021.004</u> | Rhysida actors used compromised user credentials to leverage PuTTy and remotely connect to victim systems via SSH. |

Table 14: Command and Control

| Technique Title | ID | Use |
|---------------------------|--------------|--|
| Remote Access Software | <u>T1219</u> | Rhysida actors have been observed using the AnyDesk software to obtain remote access to victim systems and maintain persistence. |

Table 15: Impact

| Technique Title | ID | Use |
|------------------------------|--------------|---|
| Data Encrypted for Impact | <u>T1486</u> | Rhysida actors encrypted victim data using a 4096-bit RSA encryption key that implements a ChaCha20 algorithm. |
| Financial Theft | <u>T1657</u> | Rhysida actors reportedly engage in "double extortion"— demanding a ransom payment to decrypt victim data and threatening to publish the sensitive exfiltrated data unless the ransom is paid. |

TLP:CLEAR

MITIGATIONS

FBI, CISA, and the MS-ISAC recommend that organizations implement the mitigations below to improve your organization's cybersecurity posture. These mitigations align with the Cross-Sector Cybersecurity Performance Goals (CPGs) developed by CISA and the National Institute of Standards and Technology (NIST). The CPGs provide a minimum set of practices and protections that CISA and NIST recommend all organizations implement. CISA and NIST based the CPGs on existing cybersecurity frameworks and guidance to protect against the most common and impactful threats, and TTPs. Visit CISA's <u>Cross-Sector Cybersecurity Performance Goals</u> for more information on the CPGs, including additional recommended baseline protections.

These mitigations apply to all critical infrastructure organizations and network defenders. FBI, CISA, and the MS-ISAC recommend incorporating secure-by-design and -default principles, limiting the impact of ransomware techniques and strengthening overall security posture. For more information on secure by design, see CISA's <u>Secure by Design</u> webpage.

- Require <u>phishing-resistant MFA</u> for all services to the extent possible, particularly for webmail, VPN, and accounts that access critical systems [<u>CPG 2.H</u>].
- Disable command-line and scripting activities and permissions. Privilege escalation and lateral movement often depend on software utilities running from the command line. If threat actors are not able to run these tools, they will have difficulty escalating privileges and/or moving laterally [CPG 2.N].
- Implement verbose and enhanced logging within processes such as command line auditing[12] and process tracking[13].
- **Restrict the use of PowerShell** using Group Policy and only grant access to specific users on a case-by-case basis. Typically, only those users or administrators who manage the network or Windows operating systems should be permitted to use PowerShell [CPG 2.E].
- Update Windows PowerShell or PowerShell Core to the latest version and uninstall all earlier PowerShell versions. Logs from Windows PowerShell prior to version 5.0 are either non-existent or do not record enough detail to aid in enterprise monitoring and incident response activities [CPG 1.E, 2.S, 2.T].
- Enable enhanced PowerShell logging [CPG 2.T, 2.U].
 - PowerShell logs contain valuable data, including historical operating system and registry interaction and possible TTPs of a threat actor's PowerShell use.
 - Ensure PowerShell instances (using the latest version) have module, script block, and transcription logging enabled (e.g., enhanced logging).
 - The two logs that record PowerShell activity are the PowerShell Windows event log and the PowerShell operational log. FBI, CISA, and the MS-ISAC recommend turning on these two Windows event logs with a retention period of at least 180 days. These logs should be checked on a regular basis to confirm whether the log data has been deleted or logging has been turned off. Set the storage size permitted for both logs to as large as possible.
- Restrict the use of RDP and other remote desktop services to known user accounts and groups. If RDP is necessary, apply best practices such as [CPG 2.W]:
 - Implement MFA for privileged accounts using RDP.

TLP:CLEAR

- Use Remote Credential Guard[14] to protect credentials, particularly domain administrator or other high value accounts.
- Audit the network for systems using RDP.
- Close unused RDP ports.
- Enforce account lockouts after a specified number of attempts.
- Log RDP login attempts.
- Secure remote access tools by:
 - Implementing application controls to manage and control execution of software, including allowlisting remote access programs. Application controls should prevent the installation and execution of portable versions of unauthorized remote access and other software. A properly configured application allowlisting solution will block any unlisted application execution. Allowlisting is important as antivirus solutions may fail to detect the execution of malicious portable executables when the files use any combination of compression, encryption, or obfuscation.
 - Apply the recommendations in CISA's joint Guide to Securing Remote Access Software.

In addition, FBI, CISA, and the MS-ISAC recommend network defenders apply the following mitigations to limit potential adversarial use of common system and network discovery techniques, and to reduce the impact and risk of compromise by ransomware or data extortion actors:

- Keep all operating systems, software, and firmware up to date. Timely patching is one of the most efficient and cost-effective steps an organization can take to minimize its exposure to cybersecurity threats. Prioritize patching <u>known exploited vulnerabilities</u> in internet-facing systems [CPG 1.E].
- **Segment networks** to prevent the spread of ransomware. Network segmentation can help prevent the spread of ransomware by controlling traffic flows between—and access to—various subnetworks and by restricting adversary lateral movement [CPG 2.F].
- Identify, detect, and investigate abnormal activity and potential traversal of the indicated ransomware with a network monitoring tool. To aid in detecting ransomware, implement a tool that logs and reports all network traffic, including lateral movement activity on a network. Endpoint detection and response (EDR) tools are particularly useful for detecting lateral connections as they have insight into common and uncommon network connections for each host [CPG 3.A].
- Audit user accounts with administrative privileges and configure access controls according to the principle of least privilege (PoLP) [CPG 2.E].
- Implement time-based access for accounts set at the admin level and higher [CPG 2.A, 2.E]. For example, the just-in-time (JIT) access method provisions privileged access when needed and can support the enforcement of PoLP (as well as the zero trust model). This is a process where a network-wide policy is set in place to automatically disable admin accounts at the AD level when the account is not in direct need. Individual users may submit their requests through an automated process that grants them access to a specified system for a set timeframe when they need to support the completion of a certain task.

TLP:CLEAR

- **Implement a recovery plan** to maintain and retain multiple copies of sensitive or proprietary data and servers in a physically separate, segmented, and secure location (e.g., hard drive, storage device, or the cloud).
- **Maintain offline backups of data** and regularly maintain backups and their restoration (daily or weekly at minimum). By instituting this practice, organizations limit the severity of disruption to business operations [CPG 2.R].
- Ensure all backup data is encrypted, immutable (i.e., cannot be altered or deleted), and covers the entire organization's data infrastructure [CPG 2.K, 2.L, 2.R].
- Forward log files to a hardened centralized logging server, preferably on a segmented network [CPG 2.F]. Review logging retention rates, such as for VPNs and network-based logs.
- **Consider adding an email banner to emails** received from outside your organization [CPG 2.M].
- **Disable hyperlinks** in received emails.

VALIDATE SECURITY CONTROLS

In addition to applying mitigations, FBI, CISA, and the MS-ISAC recommend exercising, testing, and validating your organization's security program against the threat behaviors mapped to the MITRE ATT&CK for Enterprise framework in this advisory. FBI, CISA, and the MS-ISAC recommend testing your existing security controls inventory to assess how they perform against the ATT&CK techniques described in this advisory.

To get started:

- 1. Select an ATT&CK technique described in this advisory (see Tables 6-15).
- 2. Align your security technologies against the technique.
- 3. Test your technologies against the technique.
- 4. Analyze your detection and prevention technologies' performance.
- 5. Repeat the process for all security technologies to obtain a set of comprehensive performance data.
- 6. Tune your security program, including people, processes, and technologies, based on the data generated by this process.

FBI, CISA, and the MS-ISAC recommend continually testing your security program, at scale, in a production environment to ensure optimal performance against the MITRE ATT&CK techniques identified in this advisory.

REPORTING

FBI is seeking any information that can be shared, to include boundary logs showing communication to and from foreign IP addresses, a sample ransom note, communications with Rhysida actors, Bitcoin wallet information, decryptor files, and/or a benign sample of an encrypted file.

Additional details requested include: a targeted company point of contact, status and scope of infection, estimated loss, operational impact, transaction IDs, date of infection, date detected, initial attack vector, and host and network-based indicators.

FBI and CISA do not encourage paying ransom as payment does not guarantee victim files will be recovered. Furthermore, payment may also embolden adversaries to target additional organizations, encourage other threat actors to engage in the distribution of ransomware, and/or fund illicit activities. Regardless of whether you or your organization have decided to pay the ransom, FBI and CISA urge you to promptly report ransomware incidents to the FBI's Internet Crime Complaint Center (IC3) at Ic3.gov, a local FBI Field Office, or CISA via the agency's Incident Reporting System or its 24/7 Operations Center at report@cisa.gov or (888) 282-0870.
